

AN INTERNSHIP REPORT

“FRONTEND INTERNSHIP ON JUST INTERNSHIP”

Submitted To

**School of Computer Science and Engineering
IILM University, Greater Noida, U.P.**

In partial fulfilment of the requirement of degree of
B.Tech (Computer Science and Engineering)

Submitted By

AMAN KHAN

Roll Number: [25SCS1003005490]

Batch: [2025-29]

Internship Organization: JUST INTERNSHIP

Internship Duration: 21st August 2026 – 03rd September 2026

2026–27

CANDIDATE'S DECLARATION

I, AMAN KHAN, hereby declare that the internship report titled "HTML & CSS Responsive Landing Page" has been completed by me to fulfil the requirement for the award of the degree of Bachelor of Technology in Computer Science and Engineering at IILM University, Greater Noida, Uttar Pradesh. The report presents the work undertaken during my internship with Just Internship from 21st August 2026 to 03rd September 2026.

I further declare that the technical description in this report is based on the documented internship activities and project requirements. All external references used for technical explanation have been acknowledged appropriately. This report is intended to represent my own academic work and has not been submitted to any other institute for the fulfilment of another degree or diploma requirement.

I understand that I shall be responsible for any copyright violation or other academic issue arising from material that is not appropriately acknowledged.

Signature: _____

Student Name: AMAN KHAN

Roll No.: [25SCS1003005490]

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who supported me during the completion of my internship and the preparation of this report. The internship provided me with an opportunity to move beyond classroom concepts and practise the fundamentals of front-end web development through a structured, task-based project.

I am thankful to Just Internship for providing the internship opportunity and for the project-based learning experience. The four-stage progression of the work helped me understand how a web page can be developed step by step, beginning with semantic HTML, followed by CSS styling, responsive layout development, and finally interactive navigation using JavaScript.

I also express my gratitude to IILM University, Greater Noida, and the School of Computer Science and Engineering for providing the academic environment and support required to complete the internship as part of my B.Tech Computer Science and Engineering programme.

Finally, I am grateful to my parents and family for their encouragement and support throughout the learning and documentation process.

4. PROJECT DESCRIPTION

4.1 Introduction

This internship report presents the work completed during a structured front-end web-development internship with Just Internship. The project was titled “HTML & CSS Responsive Landing Page” and was carried out from 21st August 2026 to 03rd September 2026. The project focused on building a responsive static landing page while developing a practical understanding of HTML5, CSS3, and Vanilla JavaScript.

The internship followed a progressive four-task workflow. The first task established the project foundation and semantic HTML structure. The second task introduced visual styling through a dedicated CSS stylesheet, including typography, colours, spacing, CSS variables, and layout techniques. The third task focused on responsiveness through Flexbox, CSS Grid, and media queries. The fourth task added responsive navigation using Vanilla JavaScript and prepared the static website for possible hosting.

The project deliberately avoided advanced frameworks and unnecessary dependencies. This made it possible to focus on the fundamentals of web development and to understand how the browser combines structure, presentation, responsive behaviour, and interaction. The overall experience therefore served as a practical exercise in turning a set of task requirements into a coherent, maintainable front-end project.

Figure 7.1 Project Development Workflow

Stage	Focus	Result
1	Requirement understanding & set-up	Clear project foundation
2	Semantic HTML	Structured landing-page content
3	CSS styling	Consistent visual presentation
4	Responsive layout	Desktop, tablet and mobile adaptation
5	JavaScript interaction	Responsive mobile navigation
6	Cleanup & deployment readiness	Simple static project prepared for hosting

4.2 Organization Profile

The internship certificate identifies Just Internship as the organization through which the internship was completed. The certificate records the project title as “HTML & CSS RESPONSIVE LANDING PAGE” and confirms the internship period from 21st August 2026 to 03rd September 2026. The certificate also identifies Certificate ID JI-2026-000017.

No broader organizational profile, such as company history, employee strength, client portfolio, revenue, or office locations, has been provided in the supplied internship evidence. Accordingly, this report does not introduce unsupported organizational claims. The organization is discussed here only in the context necessary to document the internship accurately.

4.3 Problem Statement

A landing page must communicate information clearly while remaining usable on different screen sizes. A page that is built only for a large desktop display can become difficult to navigate on tablets and mobile devices, while a page with poorly organized HTML or inconsistent styling can become difficult to maintain. The project therefore addressed the practical problem of developing a simple static landing page with meaningful structure, consistent presentation, responsive layout behaviour, and basic interactive navigation.

The project also addressed a learning problem: how to understand the fundamental relationship between HTML, CSS, and JavaScript without depending on a front-end framework. By implementing the page directly with browser-native technologies, the internship provided hands-on practice in semantic structure, visual styling, responsive layout techniques, DOM interaction, and static-site deployment concepts.

4.4 Project Objectives

- To understand the use of semantic HTML5 elements for organizing a web page.
- To create a clear and maintainable static landing-page structure.
- To apply CSS3 for typography, colours, spacing, borders, and visual hierarchy.
- To use CSS variables to maintain consistent theme values.
- To understand and apply Flexbox for one-dimensional layouts.
- To understand and apply CSS Grid for structured multi-column layouts.
- To implement responsive behaviour using CSS media queries.
- To adapt page content for desktop, tablet, and mobile viewport sizes.
- To implement a responsive hamburger navigation menu.
- To practise DOM selection and event handling with Vanilla JavaScript.
- To understand the basic requirements of preparing a static website for hosting.
- To improve the ability to document and explain a front-end project from setup through completion.

4.5 Scope of the Project

The scope of the project is limited to the development of a responsive static landing page using HTML5, CSS3, and Vanilla JavaScript. The project covers the page structure, visual presentation, responsive behaviour, internal navigation, mobile menu interaction, code organization, and preparation for static deployment.

The implementation is intentionally lightweight. It does not include server-side processing, a database, authentication, user accounts, REST APIs, or an application framework. The scope is therefore appropriate for a foundational front-end internship in which the main objective is to understand the core technologies used by browsers to render and interact with a web page.

In Scope	Out of Scope
Semantic HTML5 structure	Backend services
CSS3 styling and theme variables	Database
Flexbox and CSS Grid	Authentication / user accounts
Responsive media queries	REST APIs
Internal anchor navigation	Server-side processing
Mobile hamburger navigation	Advanced front-end frameworks
Vanilla JavaScript DOM interaction	Package/build systems
Static-hosting readiness	Production backend integration

4.6 Technologies and Tools Used

Technology	Purpose in the Project
HTML5	Semantic page structure, sections, navigation, and content organization
CSS3	Visual styling, typography, spacing, colours, borders, and layout
CSS Variables	Reusable theme values and consistent styling
Flexbox	Flexible one-dimensional alignment and layout
CSS Grid	Two-dimensional card and content layouts
Media Queries	Responsive changes for different viewport sizes
Vanilla JavaScript	DOM interaction, event handling, and mobile navigation
Static Hosting Concepts	Preparation for platforms such as Netlify, Vercel, or GitHub Pages

4.6.1 HTML5

HTML5 provides the structural foundation of the landing page. Semantic elements such as header, nav, main, section, and footer give the page a meaningful hierarchy. Internal anchor links connect navigation items to page sections, allowing the site to behave as a coherent one-page experience without requiring a routing library.

4.6.2 CSS3

CSS3 controls the presentation of the page. The documented project approach includes typography, colour choices, spacing, borders, rounded corners, CSS variables, Flexbox, CSS Grid, and responsive media queries. Keeping these rules in a separate style.css file helps separate presentation from document structure and makes later visual adjustments easier.

4.6.3 Vanilla JavaScript

Vanilla JavaScript is used for the interactive part of the project, particularly the mobile navigation menu. The documented approach uses DOM selection, event listeners, and CSS class toggling to show or hide navigation links. This provides a simple example of how JavaScript can change the browser-rendered interface without requiring a framework.

4.6.4 Project Environment

The project is designed to run as a static website in a modern web browser and does not require a framework build system, package manager, or backend service. The supplied documentation describes the project in terms of its core files: `index.html`, `style.css`, `script.js`, and `README.md`.

4.7 System Architecture

Because the project is a static front-end website, its architecture is intentionally simple. The browser loads the HTML document, applies the CSS presentation rules, evaluates responsive media queries according to the viewport, and executes JavaScript for interactive behaviour.

Layer	Role
User / Browser	Provides the environment in which the landing page is viewed and interacted with.
HTML Structure	Defines the semantic document hierarchy and page content.
CSS Presentation	Controls typography, colours, spacing, borders, and visual layout.
Responsive Layout	Uses Flexbox, Grid, and media queries to adapt the page to viewport size.
JavaScript Interaction	Handles DOM events and mobile navigation behaviour.
Browser Rendering	Combines structure, presentation, and interaction into the visible webpage.

Figure 7.2 Static Front-End System Architecture

Conceptual flow: User → HTML Structure → CSS Presentation → Responsive Layout → JavaScript Interaction → Browser Rendering.

4.7.1 Relationship Between Project Files

File	Primary Responsibility
index.html	Semantic structure, navigation, sections, content, and footer
style.css	Theme, typography, spacing, layout, responsive rules, and navigation styles
script.js	Mobile menu interaction, event listeners, and class-based visibility changes
README.md	Project description, structure, usage information, and deployment guidance

Table 7.3 Project File Structure

4.8 Methodology

The internship was completed as a progressive development process. Each task added a new layer of capability to the landing page while retaining the simple structure established in the earlier stages. This approach made it possible to connect individual front-end concepts with a visible project outcome.

Task	Focus Area	Major Activities	Outcome
Task 1	Project Setup & Semantic HTML	Project structure, index.html, semantic elements, internal anchor navigation	Structured landing-page foundation
Task 2	CSS Theme & Styling	style.css, variables, typography, colours, spacing, Grid/Flexbox styling	Consistent visual presentation
Task 3	Flexbox/Grid Responsiveness	Media queries, responsive grids, wrapping, spacing, overflow considerations	Multi-device responsive layout
Task 4	Navigation & Deployment	Hamburger menu, DOM events, class toggling, CSS cleanup, hosting readiness	Interactive navigation and static deployment readiness

Table 7.4 Task-wise Methodology

4.8.1 Task 1 — Project Setup & Semantic HTML

The first stage established the project foundation. The main page was created as index.html and organized using semantic HTML5 elements. Header and navigation content were separated from the main page content, while sections and a footer provided a clear document hierarchy. Internal anchor links were associated with section IDs so that navigation could move the user to relevant parts of the page.

The key learning from this stage was that HTML is responsible for meaning and structure rather than visual decoration. A well-organized semantic structure also provides a better foundation for styling and future maintenance.

4.8.2 Task 2 — CSS Theme & Styling

The second stage introduced the visual layer through a separate `style.css` file. Theme variables were used to centralize reusable colour values, while typography, spacing, borders, and layout rules were applied to the page. Flexbox and CSS Grid were used where appropriate to organize content and card-based areas.

Separating the stylesheet from the HTML kept the responsibilities of the files clear. It also made it easier to adjust the visual presentation without changing the semantic document structure.

4.8.3 Task 3 — Flexbox/Grid Responsiveness

The third stage focused on responsive design. CSS media queries were used to adapt the page according to viewport width. Multi-column content could wrap or become more compact on smaller displays, while margins, padding, and other spacing values were adjusted to preserve usability.

Responsive considerations included card wrapping, text width, image containment, navigation behaviour, and avoidance of unnecessary horizontal scrolling. The intended targets were desktop, tablet, and mobile layouts rather than a single fixed screen size.

4.8.4 Task 4 — Navigation & Deployment

The fourth stage added interactive navigation for smaller screens. A hamburger control was paired with Vanilla JavaScript event handling so that the navigation menu could be shown or hidden through CSS class toggling. The final stage also included a cleanup pass over the layout and stylesheet and preparation of the project for static hosting.

The documented hosting options include Netlify, Vercel, and GitHub Pages. The project is described as deployment-ready rather than as a live deployed application because no verified live URL has been supplied.

4.8.5 Development Workflow

The complete development workflow can be summarized as follows:

Step	Description
1	Understand the task requirements and establish the project structure.
2	Create the semantic HTML foundation and internal navigation.
3	Apply CSS styling, theme variables, typography, and layout.
4	Introduce responsive behaviour using Flexbox, Grid, and media queries.
5	Add mobile navigation using Vanilla JavaScript.
6	Review layout and CSS organization and prepare for static hosting.

Figure 7.1 Project Development Workflow

4.8.6 Beginner-Friendly Coding Principles

- Keep the source code readable and easy to inspect.
- Use descriptive class and variable names.
- Prefer straightforward browser-native features over unnecessary abstraction.
- Keep HTML, CSS, and JavaScript responsibilities separate.
- Avoid unnecessary frameworks, dependencies, and build systems.
- Make each implementation choice simple enough to explain during an academic review.

4.8.7 Responsive Design Considerations

On desktop-sized screens, the page can use the available horizontal space for multi-column arrangements and full navigation. On tablet-sized screens, content should wrap or reduce its width naturally. On mobile-sized screens, content becomes more compact and the navigation adapts to the hamburger-menu interaction. The documented project does not specify exact breakpoint values, so this report does not invent them.

Figure 7.3 Responsive Layout Concept

4.9 Expected Outcomes

The internship was designed to produce both a working project foundation and practical learning outcomes. The expected outcomes are supported by the documented four-task progression and include a stronger understanding of how a static webpage is structured, styled, made responsive, and enhanced with basic JavaScript interaction.

From an HTML perspective, the project provides experience with semantic structure, navigation, section IDs, and static page organization. From a CSS perspective, it provides practical exposure to selectors, variables, typography, spacing, Flexbox, CSS Grid, media queries, and responsive layouts. JavaScript work adds experience with DOM selection, event listeners, click interactions, and CSS class toggling.

The internship also introduces static deployment concepts. Since the project consists of browser-native front-end files and does not depend on a backend or framework build process, it can be prepared for static hosting. The documented scope identifies Netlify, Vercel, and GitHub Pages as possible hosting options, while correctly avoiding an unsupported claim that a live deployment was completed.

Skill Area	Skills Learned / Demonstrated
HTML	Semantic HTML5, hierarchy, navigation links, section IDs, static organization
CSS	Selectors, variables, typography, colours, spacing, borders, Flexbox, Grid, media queries
JavaScript	DOM selection, event listeners, click interactions, class toggling
Responsive Design	Desktop/tablet/mobile adaptation, wrapping, spacing, overflow considerations
Deployment Concepts	Static hosting readiness and framework-free deployment concepts
Documentation	Task tracking, project structure, implementation explanation, evidence-based reporting

Table 7.5 Skills Learned and Demonstrated

4.10 Certificates of Completion and Communication Proof

4.10.1 Internship Completion Certificate

The supplied internship certificate is included in this report as the primary completion evidence. It records the candidate name as Aman Khan, the project as “HTML & CSS RESPONSIVE LANDING PAGE,” the organization as Just Internship, Certificate ID JI-2026-000017, and the internship period from 21st August 2026 to 03rd September 2026.

The certificate also records the authorized signatories as Dharma Kaul, Founder & CEO, and Bhadesh Kaul, Program Manager. The original certificate image is reproduced without redesign so that the evidence remains faithful to the supplied document.

Figure 7.4 Internship Completion Certificate

4.10.2 Communication and Supporting Evidence

The formal evidence supplied for this report includes the internship completion certificate. No additional offer letter, joining letter, email thread, or other communication proof has been supplied in the current report package. If the university requires such

evidence, it can be appended separately without altering the factual content of this report.

APPENDIX A — FINAL PROJECT VERIFICATION CHECKLIST

Area	Documented Status
Project structure	index.html, style.css, script.js, README.md
HTML	Semantic HTML5, header, nav, main, section, footer, internal anchor navigation
CSS	Dedicated stylesheet, variables, typography, colours, spacing, Flexbox/Grid, media queries
JavaScript	Vanilla JavaScript, hamburger menu, event listener, class toggling
Responsive design	Desktop, tablet, mobile, wrapping, overflow and spacing considerations
Deployment	Static hosting approach documented; no unsupported live URL claimed

This checklist reflects the supplied project documentation. It should be read as a record of documented scope and requirements rather than as independent laboratory measurement or third-party verification.
